

Dorit

An ideal cut flower hybrids with golden-yellow petals and dark brown disks, completely devoid of pollen. The dorit petals are slightly deeper yellow. The inflorescence's size is relatively large and it partly dictated by the plant population and by the amount of water the plant absorbed. Depending on the temperatures, the flower may be ready for cutting 65-130 days after sowing. Dorit is usually 7-10 days later than Orit. Both varieties are cold resistant and can be sown at least two weeks earlier than standard varieties in spring.
